

COMP3411/9814: Artificial Intelligence

1b. Classifying Tasks

Alan Blair

School of Computer Science and Engineering

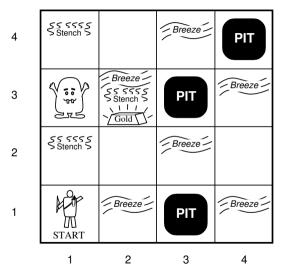

February 15, 2024

Examples of Al Tasks

- → Week 1: Wumpus World, Robocup Soccer
- → Week 2: Constraint Satisfaction (N-queens, Sudoku)
- → Week 3: Path Planning (mazes, graph search)
- → Week 4: Path Search Puzzles (8-puzzle, Rubik's cube)
- ➤ Week 5: Games (board games, dice games, card games)

Wumpus World

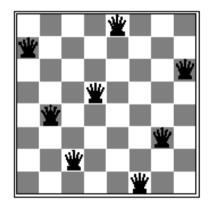

Robocup Soccer

Constraint Satisfaction Problems (Week 2)

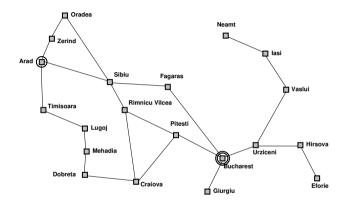

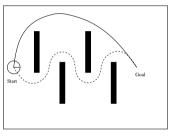

| 9 | | | | 6 | | | | 3 |
|---|---|---|---|---|---|---|---|---|
| 1 | | 5 | | 9 | 3 | 2 | | 6 |
| | 4 | | | 5 | | | | 9 |
| 8 | | | | | | 4 | 7 | 1 |
| | | 4 | 8 | 7 | | | | |
| 7 | | 2 | 6 | | 1 | | | 8 |
| 2 | | | | | | | | |
| 5 | | | | 3 | 2 | | 9 | 4 |
| | 8 | 7 | | 1 | 6 | 3 | 5 | |

N-queens Sudoku

Week 3: Path Planning

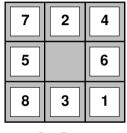

Trajectory Planning

Traveling in Romania

Week 4: Path Search Puzzles

Start State

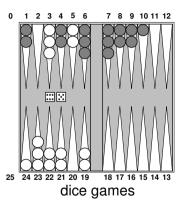

8-Puzzle

Rubik's Cube

Games (Week 5)

board games

card games

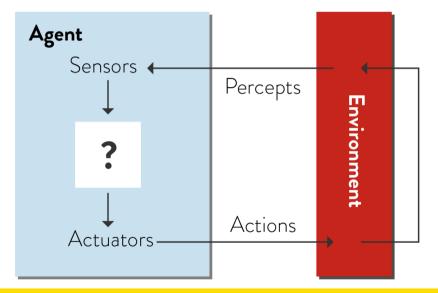

Specifying and Classifying Tasks

We want a unified framework that can be used to specify, characterize, compare and contrast different AI tasks.

Agent Model

Agents as functions

Agents can be evaluated empirically, sometimes analysed mathematically Agent is a function from *percept sequences* to actions Ideal rational agent would pick actions which are expected to maximise the performance measure.

The PEAS model of an Agent

- → Performance measure
- → Environment
- → Actuators
- → Sensors

Example: Playing Chess

Performance measure: +1 for a Win, $+\frac{1}{2}$ for a Draw, 0 for a Loss.

Environment: board, pieces

Actuators: move piece to new square Sensors: which piece is on which square

Example: Automated Taxi

Performance measure: safety, reach destination, maximize profits, obey laws, passenger comfort, . . .

Environment: city streets, freeways, traffic, pedestrians, weather, customers, ...

Actuators: steer, accelerate, brake, horn, speak/display, ...

Sensors: video, accelerometers, gauges, engine sensors, keyboard, GPS, ...

Robots

DARPA Grand Challenge

DARPA Grand Challenge

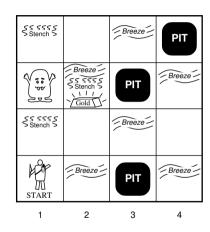

Example AI Environment - Wumpus World

→ Environment

- Squares adjacent to Wumpus are Smelly
- → Squares adjacent to Pit are Breezy
- → Glitter iff Gold is in the same square
- → Shoot
 - → kills Wumpus if you are facing it
 - → uses up the only arrow
- → Grab
 - → picks up Gold if in same square

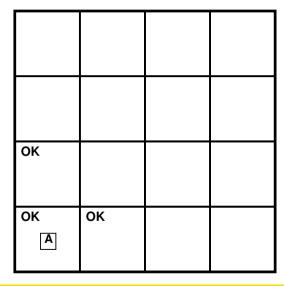

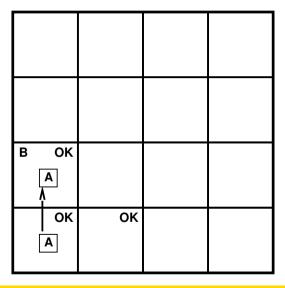

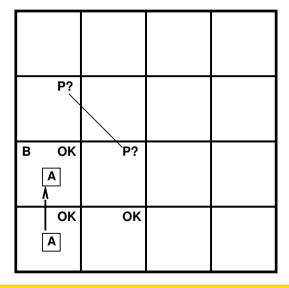

Wumpus World PEAS description

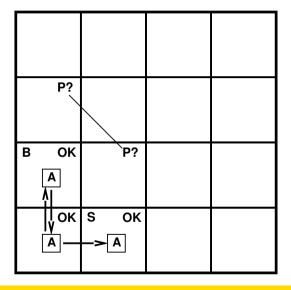

- → Performance measure
 - → Return with Gold +1000, death -1000
 - → -1 per step, -10 for using the arrow
- → Environment
 - → Gridworld with Pits, Gold, Wumpus
- → Actuators
 - → Left, Right, Forward, Grab, Shoot
- → Sensors
 - → Breeze, Glitter, Stench

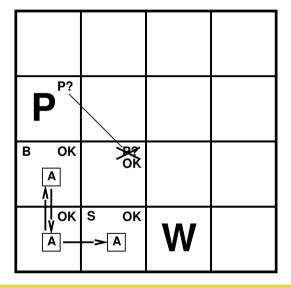

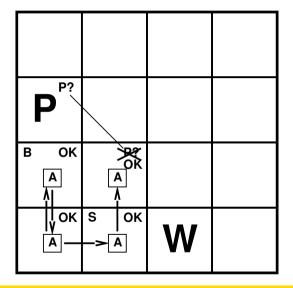

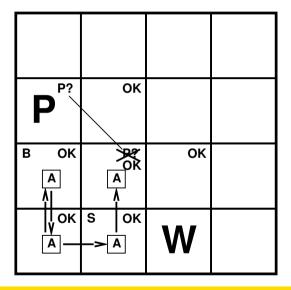

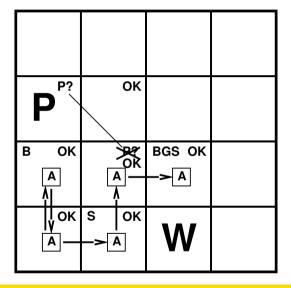

Classifying Tasks

| Simulated | vs. | Situated or Embodied |
|------------------|-----|----------------------|
| Static | VS. | Dynamic |
| Discrete | VS. | Continuous |
| Fully Observable | VS. | Partially Observable |
| Deterministic | VS. | Stochastic |
| Episodic | VS. | Sequential |
| Known | VS. | Unknown |
| Single-Agent | vs. | Multi-Agent |

Environment Types

Simulated: a separate program is used to simulate an environment, feed percepts to agents, evaluate performance, etc.

Static: environment doesn't change while the agent is deliberating

Discrete: finite (or countable) number of possible percepts/actions

Fully Observable: percept contains all relevant information about the world

Deterministic: current state of world uniquely determines the next

Episodic: every action by the agent is evaluated independently

Known: the rules of the game, or physics/dynamics of the environment are known to the agent

Single-Agent: only one agent acting in the environment

Chess vs. Robocup Soccer

Robocup Soccer

Simulated vs. Situated or Embodied

→ Chess is Simulated, Robocup is Situated and Embodied

Simulated: a separate program is used to simulate an environment,

feed percepts to agents, evaluate performance, etc.

Situated: the agent acts directly on the actual environment

Embodied: the agent has a physical body in the world

Question: If Chess is played on a physical board with actual pieces, would

it become embodied?

Simulated vs. Situated or Embodied

→ Chess is *Simulated*, Robocup is *Situated* and *Embodied*

Simulated: a separate program is used to simulate an environment,

feed percepts to agents, evaluate performance, etc.

Situated: the agent acts directly on the actual environment

Embodied: the agent has a physical body in the world

Question: If Chess is played on a physical board with actual pieces, would it become embodied?

Answer: Yes it would; however, we normally "abstract" away the game itself (choice of moves), and treat the movement of the pieces as a separate task.

Static vs. Dynamic

- → Chess is Simulated, Robocup is Situated and Embodied
- → Chess is *Static*, Robocup is *Dynamic*

Static: the environment does *not* change while the agent is thinking Dynamic: the environment *may* change while the agent is thinking e.g. if the ball is in front of you but you take too long to act, another player may come in and kick it away

Notes:

- → In a multi-player game, Static environment will obviously change when the opponent moves, but cannot change once it is "our turn".
- → In tournament Chess, the clock will tick down while the player is thinking (thus making it slightly non-static).

Discrete vs. Continuous

- → Chess is Simulated, Robocup is Situated and Embodied
- → Chess is Static, Robocup is Dynamic
- → Chess is *Discrete*, Robocup is *Continuous*

Discrete: only a finite (or countable) number of discrete percepts / actions

Continuous: states, percepts or actions can vary continuously

e.g. each piece must be on one square or the other, not half way in between.

Fully Observable vs. Partially Observable

- → Chess is *simulated*, Robocup is *Situated* and *Embodied*
- → Chess is *Static*, Robocup is *Dynamic*
- → Chess is *Discrete*, Robocup is *Continuous*
- Chess is Fully Observable, Robocup (Legged) is Partially Observable
 Fully Observable: agent percept contains all relevant information about the world

Partially Observable: some relevant information is hidden from the agent [watch Dog's Eye View video] [watch Melbourne vs. Cornell video]

Note:

The Robocup F180 League is close to fully observable, because the robots have access to an external computer connected to an overhead camera.

Deterministic vs. Stochastic

- → Chess is Simulated, Robocup is Situated and Embodied
- → Chess is *Static*, Robocup is *Dynamic*
- → Chess is *Discrete*, Robocup is *Continuous*
- → Chess is fully observable, Robocup (Legged) is Partially Observable
- → Chess is *Deterministic*, Robocup is *Stochastic*

Deterministic: the current state uniquely determines the next state

Stochastic: there is some *random* element involved

Note:

The non-determinisim partly arises because the physics can only be modeled with limited precision. But, even if it could be modeled perfectly, there would still be randomness due to quantum mechanical effects.

Episodic vs. Sequential

- → Chess is Simulated, Robocup is Situated and Embodied
- → Chess is *Static*, Robocup is *Dynamic*
- → Chess is *Discrete*, Robocup is *Continuous*
- → Chess is *Fully Observable*, Robocup (Legged) is *Partially Observable*
- → Chess is *Deterministic*, Robocup is *Stochastic*
- → Both Chess and Robocup are Sequential

Episodic: every action by the agent is evaluated independently

Sequential: the agent is evaluated based on a long sequence of actions Both Chess and Robocup are considered Sequential, because evaluation only happens at the end of a game, and it is necessary to plan several steps ahead in order to play the game well.

Known vs. Unknown

- → Chess is Simulated, Robocup is Situated and Embodied
- → Chess is *Static*, Robocup is *Dynamic*
- → Chess is *Discrete*, Robocup is *Continuous*
- → Chess is Fully Observable, Robocup (Legged) is Partially Observable
- → Chess is *Deterministic*, Robocup is *Stochastic*
- → Both Chess and Robocup are Sequential
- → Both Chess and Robocup are Known

Known: the rules of the game, or physics / dynamics of the environment, are known to the agent.

Note:

Video Games like Infinite Mario are sometimes set up in such a way that the dynamics of the environment are Unknown to the agent.

Single-Agent vs. Multi-Agent

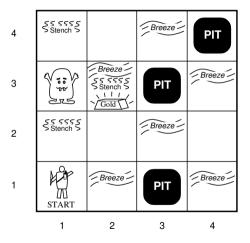

- → Chess is Simulated, Robocup is Situated and Embodied
- → Chess is *Static*, Robocup is *Dynamic*
- → Chess is *Discrete*, Robocup is *Continuous*
- → Chess is Fully Observable, Robocup (Legged) is Partially Observable
- → Chess is *Deterministic*, Robocup is *Stochastic*
- → Both Chess and Robocup are Sequential
- → Both Chess and Robocup are Known
- → Both Chess and Robocup are *Multi-Agent*

Examples of Single-Agent tasks include:

- → solving puzzles like Sudoku, or Rubik's cube
- → Solitaire card games

Wumpus World

Simulated ?
Static ?
Discrete ?
Fully Observable ?
Deterministic ?
Episodic ?
Known ?
Single-Agent ?

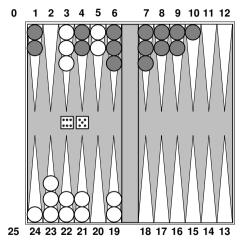

Wumpus World

- → Like Chess, Wumpus World is *Simulated*, *Static*, *Discrete*, *Sequential* and *Known*.
- → Wumpus World is *Partially Observable* for example, you don't know where the Wumpus is.
- Wumpus World is normally considered *Deterministic*, because the location of the Wumpus, Gold and Pits are determined at the beginning and don't change after that.
- → Wumpus World is *Single-Agent*. We consider the Wumpus as a "natural feature", because it doesn't move and can't make any choices.

Dice Games (Backgammon)

Simulated ?
Static ?
Discrete ?
Fully Observable ?
Deterministic ?
Episodic ?
Known ?
Single-Agent ?

Dice Games (Backgammon)

- → Like Chess, Backgammon is *Simulated*, *Static*, *Discrete*, *Sequential* and *Known* and *Multi-Agent*.
- → Normally, we consider Backgammon to be *Fully Observable* and *Stochastic*. The dice rolls are random, but all players can see them.
- → If instead the dice rolls are generated by a computer using a pseudo-random number generator, with a specified seed, the game could be considered *Deterministic* but *Partially Observable*. In this case, the sequence of dice rolls is fully determined by the seed, but future dice rolls are not observable by the players.

Card Games (Poker, Rummy, Mahjong)

Simulated ?
Static ?
Discrete ?
Fully Observable ?
Deterministic ?
Episodic ?
Known ?
Single-Agent ?

Card Games (Poker, Rummy, Mahjong)

- → Card Games like Poker, Rummy or Mahjong are Simulated, Static, Discrete, Sequential, Known and Multi-Agent.
- → Card Games are Stochastic if the cards are shuffled during the game, but can be considered Deterministic if the cards are shuffled only once, before the game begins.
- Card Games are Partially Observable and involve Asymmetric Information in the sense that each player can see their own cards but not those of other players.

Robots

Situated and Embodied Cognition

Rodney Brooks 1991:

Situatedness: The robots are situated in the world – they do not deal with abstract descriptions, but with the "here" and "now" of the environment which directly influences the behaviour of the system.

Embodiment: The robots have bodies and experience the world directly – their actions are part of a dynamics with the world, and actions have immediate feedback on the robot's own sensations.

Situated vs. Embodied

- → Situated but not Embodied: High frequency stock trading system:
 - → it deals with thousands of buy/sell bids per second and its responses vary as its database changes.
 - but it interacts with the world only through sending and receiving messages.
- → Embodied but not Situated: an industrial spray painting robot:
 - → does not perceive any aspects of the shape of an object presented to it for painting; simply goes through a pre-programmed series of actions
 - → but it has physical extent and its servo routines must correct for its interactions with gravity and noise present in the system.

Summary

- → Al tasks or environments can be classified in terms of whether they are simulated, static, discrete, fully observable, deterministic, episodic, known, single- or multi- agent.
- The environment type strongly influences the agent design (discussed in the next section..)
